Affected items

/confirm.aspx	
Alert group	Cross site scripting (verified)
Severity	High
Description	Cross-site Scripting (XSS) refers to client-side code injection attack wherein an attacker can execute malicious scripts into a legitimate website or web application. XSS occurs when a web application makes use of unvalidated or unencoded user input within the output it generates.
Recommendations	Apply context-dependent encoding and/or validation to user input rendered on a page

Web Server	
Alert group	<b>TLS 1.0 enabled</b>
Severity	High
Description	The web server supports encryption through TLS 1.0, which was formally deprecated in March 2021 as a result of inherent security issues. In addition, TLS 1.0 is not considered to be "strong cryptography" as defined and required by the PCI Data Security Standard 3.2(.1) when used to protect sensitive information transferred to or from web sites. According to PCI, "30 June 2018 is the deadline for disabling SSL/early TLS and implementing a more secure encryption protocol – TLS 1.1 or higher (TLS v1.2 is strongly encouraged) in order to meet the PCI Data Security Standard (PCI DSS) for safeguarding payment data.
Recommendations	It is recommended to disable TLS 1.0 and replace it with TLS 1.2 or higher.
Alert variants	

Details	The SSL server (port: 443) encrypts traffic using TLSv1.0.

Alert group	Application error messages
Severity	Medium
Description	<p>This alert requires manual confirmation</p> <p>Acunetix found one or more error/warning messages. Application error or warning messages may expose sensitive information about an application's internal workings to an attacker. These messages may also contain the location of the file that produced an unhandled exception. Consult the 'Attack details' section for more information about the affected page(s).</p>
Recommendations	Verify that these page(s) are disclosing error or warning messages and properly configure the application to log errors to a file instead of displaying the error to the user.

## Web Server

### Alert group ASP.NET error message

Severity Medium

Description Application error or warning messages may expose sensitive information about an application's internal workings to an attacker.

Acunetix found an error message that may disclose sensitive information. By requesting a specially crafted URL, Acunetix generated an ASP.NET error message. The message contains a complete stack trace and Microsoft .NET Framework version.

Recommendations Adjust the application's `web.config` to enable custom errors for remote clients (refer to 'Detailed information' section).

Web Server	
Alert group	TLS 1.1 enabled
Severity	Medium
Description	The web server supports encryption through TLS 1.1, which was formally deprecated in March 2021 as a result of inherent security issues. When aiming for Payment Card Industry (PCI) Data Security Standard (DSS) compliance, it is recommended to use TLS 1.2 or higher instead. According to PCI, "30 June 2018 is the deadline for disabling SSL/early TLS and implementing a more secure encryption protocol – TLS 1.1 or higher (TLS v1.2 is strongly encouraged) in order to meet the PCI Data Security Standard (PCI DSS) for safeguarding payment data.
Recommendations	It is recommended to disable TLS 1.1 and replace it with TLS 1.2 or higher.
Alert variants	
Details	The SSL server (port: 443) encrypts traffic using TLSv1.1.

Severity	Low
Description	The HTTP responses returned by this web application include anheader named <b>X-AspNet-Version</b> . The value of this header is used by Visual Studio to determine which version of ASP.NET is in use. It is not necessary for production sites and should be disabled.
Recommendations	<p>Apply the following changes to the web.config file to prevent ASP.NET version disclosure:</p> <pre>&lt;System.Web&gt;   &lt;httpRuntime enableVersionHeader="false" /&gt; &lt;/System.Web&gt;</pre>

Alert group	Clickjacking: X-Frame-Options header
Severity	Low
Description	<p>Clickjacking (User Interface redress attack, UI redress attack, UI redressing) is a malicious technique of tricking a Web user into clicking on something different from what the user perceives they are clicking on, thus potentially revealing confidential information or taking control of their computer while clicking on seemingly innocuous web pages.</p> <p>The server did not return an <b>X-Frame-Options</b> header with the value DENY or SAMEORIGIN, which means that this website could be at risk of a clickjacking attack. The X-Frame-Options HTTP response header can be used to indicate whether or not a browser should be allowed to render a page inside a frame or iframe. Sites can use this to avoid clickjacking attacks, by ensuring that their content is not embedded into untrusted sites.</p>
Recommendations	Configure your web server to include an X-Frame-Options header and a CSP header with frame-ancestors directive. Consult Web references for more information about the possible values for this header.

Alert group	Cookies with missing, inconsistent or contradictory properties (verified)
Severity	Low
Description	At least one of the following cookies properties causes the cookie to be invalid or incompatible with either a different property of the same cookie, or with the environment the cookie is being used in. Although this is not a vulnerability in itself, it will likely lead to unexpected behavior by the application, which in turn may cause secondary security issues.
Recommendations	Ensure that the cookies configuration complies with the applicable standards.

Alert group	Access-Control-Allow-Origin header with wildcard (*) value
Severity	Informational
Description	<p>Cross-origin resource sharing (CORS) is a mechanism that allows restricted resources (e.g. fonts) on a web page to be requested from another domain outside the domain from which the resource originated. The Access-Control-Allow-Origin header indicates whether a resource can be shared based on the value of the Origin request header, "*", or "null" in the response.</p> <p>If a website responds with Access-Control-Allow-Origin: * the requested resource allows sharing with every origin. Therefore, any website can make XHR (XMLHttpRequest) requests to the site and access the responses.</p>
Recommendations	Check whether Access-Control-Allow-Origin: * is appropriate for the resource/response.

Alert group	Content Security Policy (CSP) not implemented
Severity	Informational

Description	<p>Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks.</p> <p>Content Security Policy (CSP) can be implemented by adding a <b>Content-Security-Policy</b> header. The value of this header is a string containing the policy directives describing your Content Security Policy. To implement CSP, you should define lists of allowed origins for the all of the types of resources that your site utilizes. For example, if you have a simple site that needs to load scripts, stylesheets, and images hosted locally, as well as from the jQuery library from their CDN, the CSP header could look like the following:</p> <pre>Content-Security-Policy:     default-src 'self';     script-src 'self' https://code.jquery.com;</pre> <p>It was detected that your web application doesn't implement Content Security Policy (CSP) as the CSP header is missing from the response. It's recommended to implement Content Security Policy (CSP) into your web application.</p>
Recommendations	<p>It's recommended to implement Content Security Policy (CSP) into your web application. Configuring Content Security Policy involves adding the <b>Content-Security-Policy</b> HTTP header to a web page and giving it values to control resources the user agent is allowed to load for that page.</p>

Severity	Informational
Description	One or more email addresses have been found on this website. The majority of spam comes from email addresses harvested off the internet. The spam-bots (also known as email harvesters and email extractors) are programs that scour the internet looking for email addresses on any website they come across. Spambot programs look for strings like myname@mydomain.com and then record any addresses found.

<b>Alert group</b>	<b>Subresource Integrity (SRI) not implemented</b>
<b>Severity</b>	Informational
<b>Description</b>	<p>Subresource Integrity (SRI) is a security feature that enables browsers to verify that third-party resources they fetch (for example, from a CDN) are delivered without unexpected manipulation. It works by allowing developers to provide a cryptographic hash that a fetched file must match.</p> <p>Third-party resources (such as scripts and stylesheets) can be manipulated. An attacker that has access or has hacked the hosting CDN can manipulate or replace the files. SRI allows developers to specify a base64-encoded cryptographic hash of the resource to be loaded. The integrity attribute containing the hash is then added to the &lt;script&gt; HTML element tag. The integrity string consists of a base64-encoded hash, followed by a prefix that depends on the hash algorithm. This prefix can either be sha256, sha384 or sha512.</p> <p>The script loaded from the external URL specified in the Details section doesn't implement Subresource Integrity (SRI). It's recommended to implement Subresource Integrity (SRI) for all the scripts loaded from external hosts.</p>

Recommendations	<p>Use the SRI Hash Generator link (from the References section) to generate a &lt;script&gt; element that implements Subresource Integrity (SRI).</p> <p>For example, you can use the following &lt;script&gt; element to tell a browser that before executing the https://example.com/example-framework.js script, the browser must first compare the script to the expected hash, and verify that there's a match.</p> <pre>&lt;script src="https://example.com/example-framework.js"       integrity="sha384-oqVuAfXRKap7fdgcCY5uykM6+R9GqQ8K/uxy9rx7HNQlGY11       crossorigin="anonymous"&gt;&lt;/script&gt;</pre>
